Oxygen not included food tips. Oxygen not included best food. Oxygen not included spaced out food guide. Oxygen not included foods.

We have the best foods to keep up productivity in your base. Let's dig in (like Liam's doing)! The Best Oxygen Not Included Foods to Keep Your Dupes Smiling (and Stuffed) Feeding a few dupes is easy when they crash land in the middle of an asteroid and don't expect much. But as time goes on and their tastes develop, those snobs start expecting a better quality of food. If you aren't careful, you'll end up with a colony of starving dupes, stressed to the max, because all they have to eat is meal lice (and there isn't enough of it). If you take note of the following foods, you won't need to worry. These resources are easy to find, grow, harvest, and cook, and will quickly feed your dupes (and keep them happy). Let's get the egg rolling.

10. Frost Bun Keep your warm buns frosty! Frost Buns are made from Sleet Wheat Grain, provide 1200 kcal, and have a food quality of Standard [+2]. Frost Buns are incredibly convenient in the Spaced Out! DLC, as the abundance of Sleet Wheat offers plenty of ingredients without the necessity of immediately building a farm. What's so great about it? Grow Time of 18 Cycles Spoil Time of 4 Cycles 1200 kcal Food Quality Standard [+2] Popular for Spaced Out! DLC Get it: Harvest Sleet Wheat Grain from Sleet Wheat (in ice biomes) Cook Sleet Wheat Grain (3 units) at Electric Grill 9. Berry Sludge It's like intergalactic fruit cake; only I imagine it actually tastes good. Berry Sludge is made from Bristle Berry and Sleet Wheat Grain and has a Good [+3] food quality. You can make it at the Microbe Musher, and it never spoils. If you're next to an ice biome (and all the wild Sleet Wheat), Berry Sludge is the best way to go. What's so great about it? NEVER spoils 4000 kcal Food Quality Good [+3] Great for rocket trips Get it: Sleet Wheat Grain (5 units) and Bristle Berry (1600 kcal) Cook at Microbe Musher 8. Grubfruit Preserve Easy-peasy-Grubfruit-squeezy! Add a little solar sugar (aka Sucrose) to Grubfruit and make a jam that lasts for almost ever. Grubfruit Preserves have a Good [+3] food quality and offer 2400 kcal. Cook some up at the Electric Grill. What's so great about it? Spoil Time of 16 Cycles 2400 kcal Food Quality Good [+3] Long-lasting Get it: Grubfruit (2000 kcal) and Sucrose (4000 g) Cook at Electric Grill Harvest Sucrose and Grubfruit in the Wasteland Biome 7. Mushroom Wrap If you have a lot of saltwater around your base, Mushroom Wraps may be a good option for you. Lettuce is easy to find in the saltwater biomes and (apparently) goes well with Fried Mushrooms. Make a Mushroom Wrap for a Great [+4] quality food and 4800 kcal. These offer a high morale boost but spoil after two cycles. What's so great about it? 4800 kcal Food Quality Great [+4] Lettuce is plentiful Popular in Saltwater Biomes Get it: Fried Mushroom (2800 kcal) and Lettuce (1600 kcal) Harvest Lettuce from the Waterweed plant in the Tidal Pool Biome Cook at Gas Range 6. Fried Mushroom Mushrooms harvested from the Dusk Cap can be fried at the Electric Grill to make Fried Mushrooms. These shrooms have a food quality of Poor [+1] and provide 2800 kcal. Your dupes can eat the Fried Mushrooms like this or cook them in the Gas Range and make Mushroom Wraps for another quality tier boost. What's so great about it? Spoil Time of 4 Cycles 2800 kcal Food Quality Poor [+1] Use for Mushroom Wrap Get it: Harvest Mushroom from Dusk Cap in Swamp Biome Fry Mushroom at Electric Grill 5. Mushroom The Mushroom not only provides a fair amount of food, but it's also useful for managing slime in the early game. Harvest mushrooms from Dusk Caps and eat 'em raw. With a food quality of Terrible [0], they will offer a decent morale boost until you can fry them up. What's so great about it? Grow Time of 7.5 Cycles Spoil Time of 4 Cycles 2400 kcal Food Quality Terrible [0] Use for Fried Mushroom Get it: Harvest from Dusk Cap in Swamp Biome 4. Gristle Berry Grill up some Bristle Berries for a quick and easy morale boost. Like most other recipes, Gristle Berries gain 400 kcal, and a food quality tier (from Terrible to Poor) in the cooking process and are made at the Electric Grill. What's so great about it? Spoil Time of 4 Cycles 2000 kcal Food Quality Poor [+1] Use for Stuffed Berry Get it: Harvest Bristle Berry from Bristle Blossom Cook Bristle Berry at Electric Grill 3. Bristle Berry Harvested from the Bristle Blossom plant, the Bristle Berry can be eaten raw, made into Berry Sludge and Gristle Berry, and used in the juicer. Off the bat, the Bristle Berry has a food quality of Terrible [0], which is better than meal lice or mush bars and takes only six cycles to grow. Sure, it requires light, but a ceiling light only uses 10W, and the returns are undoubtedly worth it. What's so great about it? Grow Time of 6 Cycles Spoil Time of 4 Cycles 1600 kcal Food Quality Terrible [0] Use for Gristle Berry, Berry Sludge, Juicer Get it: Harvested from Bristle Blossom 2. Omelette Yep, just a typical omelette. It's made from Raw Egg at the Electric Grill. Use an Egg Cracker to bust open any extra critter eggs you have and cook up a Standard [+2] quality Omelette. It provides 2800 kcal and spoils in 2 cycles. What's so great about it? 2800 kcal Food Quality Standard [+2] Make from excess eggs Get it: Critter farms or wild critters Cook Critter Egg at Electric Grill 1. Barbecue Sometimes poor, helpless critters die (or are killed), but that doesn't mean we should let those resources go to waste. Barbecue up the leftover/hunted meat at the Electric Grill for a Good [+3] quality food that offers 4000 kcal. Barbecue spoils in 2 cycles, so make sure to store it (and the other perishables) in Carbon Dioxide. What's so great about it? 4000 kcal Food Quality Good [+3] Use excess meat from Hatch farms Get it: Farms or wild critters Cook meat at Electric Grill You may also be interested in: Last update: Monday, August 19, 2019 Next: The Basics: The Beginning Diseases and temperature Prev: The Basics: The Beginning Technology Cultivating plants and providing food for your dupes is probably the most important thing if after sorting out the oxygen. There are many ways to provide food. You can grow plants from your own seeds, taking good care of them, or try to find an already started plantation in the caves. You can also kill some animals. The plantations have their Predicted Harvest Rating - the higher it is, the better the harvest will be and the greater the chance of getting more seeds. The PHR is determined by the temperature, concentration of gas, etc. Each duplicate needs some 1000 calories per day/cycle. Lack of food will result in deteriorating health - malnutrition will eventually kill. Everyone have their expectations of the food quality, and though they still may be able to eat less fresh products, it will negatively influence their happiness, increasing the level of stress. The requirements increase with experience. Better food requires more work and preparation before production. The food that's not quickly consumed or properly stored will start deteriorating and oozing foul air. Hence you should store it in Ration Boxes or in the Refrigerator. The encountered plants you can either mark for harvesting or dig out to get the seeds (the upper picture). During the initial stages, it's a better idea to dig them out. Sometimes you can encounter plants that live in perfect conditions (they'll radiate a faint glow). If you're extremely short on food, start making Mush Bar from Dirt and Water. Getting food at the beginning. Although you start the game with minor food reserves, you will have to start exploring other options right away. There are two quick ways out of it: either search for Muckroot or caves with Mealwood or Bristle Berry already growing in them. You just have to dig them out or order your dupes to begin auto harvest, and they'll get to work. Until you have the right technology, don't dig out any plants. They will grow and blossom without your interference. The only issue is re-planting them or achieving better harvest. You can also hunt animals, such as Hatch, which will drop meat. Most of the time there are not enough of them to provide enough food. You can also build a Microbe Musher, where Mush Bar can be created out of sheer dirt and water. The problem is that the quality of this nom is classified as "grisly" and it can cause diarrhea. However, often this will be the only solution during famine or when waiting for harvests. You can also use five units of Meal Lice and 50kgs of water to create Liceloa, consequently doubling the amount of calories (up to 1000). To create the perfect conditions for your plants to grow, you will often need a lot of work and some additional facilities, such as irrigation and air conditioning. After you unlock the Farming and Fine Dining technologies, new possibilities will open. Most importantly, you will be able to build Planter Box and new tiles: Farming and Hydroponic. The former allows you to plant seeds. You need dirt to build it. It's most useful if the place where you want to grow plants has good temperature. New tiles can be built on standard base tiles. The Farming Tiles' plantation can be upgraded with the specific fertilizer; the hydroponic tile can be joined with a system of valves, providing irrigation. This will allow you to get much better output during harvests, but you can also cultivate some plants despite unfavorable conditions. Each plant requires its own range of temperature, beyond which it doesn't grow. Each one has the perfect temperature as well, in which it will flourish and yield the most food (Harvest Rating). Spreading fertilizer and irrigation will also increase the rating. It's bets to create farming fields in locations that already have good conditions and temperature (like Sleet Wheat in winter biome). There are three tiers of crops yield: standard, good and excellent. Each subsequent tier provides more food and increases the chance for additional seeds. Make investments into at least one place in which crops should be excellent. Pay for systems that will let you maintain ideal temperature. Use a gas concentration sensor to monitor the amount of gas. Most plants need at least 150g. Ideally, the amount of gas should be greater than 750g. Below is a table with all useful information: Name Temperature range (perfect range) Time to grow to maturity/harvest interval Number of harvests and yield Harvest Rating: Standard (0-40) Good (40+) Excellent (80+) Mealwood 10 to 30 (18 to 22) 5/2.5 Meal Lice (100kcal), 3 harvests 8 units 16 units and 2 seeds Bristle Blossom 23 to 23 (-3 to 3) 10/2 Bristle Berry (1600 kcal), 5 harvests 1 unit 1 unit and 2 seeds Sleet Wheat -55 to 5 (-40 to -35) 20/0 Sleet Wheat Grain, 1 harvest 25 seeds 50 seeds 75 seeds Pincha Pepper 35 to 85 (55 to 60) 25/20 Pincha Peppernut, 3 harvests 4 units and 1 seed 4 units and 2 seeds 8 units and 2 seeds Summary: The maximum number of cycles required to get the food and the lowest possible rating for every plant: Mealwood: After 12 cycles - from 2400 kcal do 4800 kcal. Remember that Meal Lice weights a lot and takes up a lot of space in your boxes/fridges. The quality is grisly (-3). You can make a couple better meals, such as Liceloa (from 50kg of water and 5 units, i.e. 500 kcal, will yield a meal worth 1000 kcal).Bristle Blossom: after 24 cycles, 4800 kcal. Bristle Berry is one of the best tasting fruits, the quality is relatively good (-1) for a raw meal, however, and its ideal temperature requires a lot of work if you want a lot of these. Sweet Wheat. After 20 days from 25 to 75 seeds. If you use the whole yield to prepare a simple meal, Frost Bun, you will get from 25000 to 75000 calories. It requires some waiting, and the temperature has to be pretty low, but the high calories output should compensate. Notice that you use the seeds for both planting and making meals!Pincha Peppernut: after 85 cycles you'll get from 12 to 24 seeds. Used to season other meals, has no calories itself. Increases the quality of meals.Remember that you get the seeds during the last harvest of the given plantation. That's when you should make sure the Harvest Rating is as high as possible. Bristle Blossom and Sleet Wheat require clean water if you want to irrigate them. Mealwood and Pincha Pepper actually require polluted water, and lots of it. All plants require fertilizer (apart from Pincha - it needs Phosphorous). All plants apart from Mealwood have a décor bonus, but Mealwood is the fastest-growing and most economic plant. As already mentioned, you will quickly gain access to Microbe Musher, and after discovering the Fine Dining technology, you will also be able to build a Cooking Station. There, your people can make much better and nourishing meals. Make sure that the best cooks take care of cooking, and nobody else. Better meals will require Pincha Peppernut. It's a spice and it can be combined with other meals to produce better food. Next: The Basics: The Beginning Diseases and temperature Prev: The Basics: The Beginning Technology
