Current electricity mcq pdf

Warning: Can only detect less than 5000 characters The two main types of electric current. Continuous current (DC) is the unidirectional electric charge flow. The electric charge flows into a constant direction, distinguishing it from alternating current (AC). Previously used "for direct current was the galvanic current. The direct current is produced by sources such as batteries, Δ ϵ thermocouples, solar cells and electric machines type switch type Dynamo. The direct current can flow into a conductor like a Thread, but it can also flow through the semiconductors, Δ ϵ insulators, or even through an aspirin as in [Electron or Electronic Beams or Ions. In the alternating current (AC, also AC), the electric charge movement reverses periodically. To the direct current, the electric charge flow is only in one direction. AC is the form of electric power delivered to companies and residences. The usual waveform of a power Δ ϵ AC circuit is a sine wave . Some applications use different waveforms, such as triangular or square waves. Audio ϵ and radiodi signals are transported on electric cables are also examples of alternating current. An important objective in these applications is the recovery of coded information (or modulated) on the AC signal. signal.
