My text messages

My text messages are not going through iphone. My text messages are green. My text messages are not notifying me. My text messages are silent. My text messages won't send. My text messages disappeared. My text messages are not going through. My text messages are not coming through.

Call your mother! And do it free. In honor of Mother's Day, Skype offers free Skype Out calls all day. If you are in the United States or Canada, Skype will give you unlimited calls from 5am from 13 to 4:49 May 14 to call your mother, your sister or only random numbers in India. Along the same lines, T-Mobile customers can send messages all day free in their "Stick Together" campaign. So, then send your mother's message happy, right? Hi Mom: Skype Your Mom For Free On Mama's Day [Gizmodo] Stick Together Day [T-Mobile via TechCrunch] In my last road speech, "13 things there need to survive this recession," I make the recommendation to keep your shoes sales on - After all, Managing Directors are demanding more top-line results from IT investments, according to a recent Forrester research study. For over a decade, the es have been invested in top-line technologies such as customer relationship management, business resource planning and content management systems. But my conversations with CIO and chats with friends and family convince me that companies are missing on effective technology that is starting to drive high-line results and improve customer satisfaction levels. And this technology? Send messages! Texting, or SMS (for short message service) involves messages from 160 characters or not. Twitter (at 140 characters) is the child poster in the category, but the text is much more than often-impress "tweets". And it is gaining a point of view as a business marketing tool and convincing sales. I participated in a Wall Street conference where the presenter showed as a SMS strategy in a large chain of drugs brought customer satisfaction up to 10 percentage points. The presentation did not detail the top-line earnings of the SMS strategy, but most would agree that satisfied customers tend to buy more unhappy products. In the question and reply part of the presentation, an analyst asked: "Why doesn't the company simply exploit an e-mail strategy to inform customers?" The answer: a continuously changed price strategy brought the company to SMS. He has reasoned that customers certainly could be reached by e-mail, but there were two problems with it: spam filters have shielded many of the messages and many customers were not online all day. But those customers have had cell phones that have constantly brought with them "mobile phones that were on 24/7. I don't encourage you to create a company policy for use of the text, it would never work. But I suggest you organize a meeting with your key sales and marketing colleagues to frame how your company can reach customers with a strategy Another advantage of embracing text messaging at work? Your children will think you're really strong! And your CEO, too. Copyright © 2009 IDG Communications, Inc. With the NSA that comes across everyone's pockets without permission, and nosy siblings snooping through the message history while you're away, there's never been a better time to start encrypting your ownMessages that is not today. As we explain in this article, the encrypted text is not always necessary, but it can still be a welcome guarantee for every time your family, or business partners need to communicate sensitive information from one side of the world to another. Why should I encrypt? â € œThat what happens if I have nothing to hide? â € â € is a common answer that could be obtained from some people when the news of the NSA espionage programs are discussed. â € œWhere © I should encrypt my lyricsâ € is another that usually follows closely, and my answer is almost always the same: according to a powerpoint slide cache released by an Edward Snowden, it seems that the NSA was actively hunted down encryption efforts for years, and exterminate any encryption that could represent a threat to read our texts, trace our calls and rifles through our private emails. In the same set of slides, the world has also learned that the only encryption reason is Breakable at this time is because such a small percentage of the population currently employs any type of extra safety layer to protect their communications. The idea behind using these applications or services is that since more people start encrypting their messages, not only can we make NSA's work a little harder, we can also be sure that no other third parties is Able to break the code of private conversations. The encryption of the text is perfect for the top-level discussion of corporate products that come to the market, the exchange of files containing private financial data, or sending personal information of the family that you do not want to go out into the world. Not only that, but also the unique advantage of ensuring none of the messages sent or received will be used for advertising or marketing purposes, as one could find products competing from Whatsapp or Facebook Messenger. So, with so many different benefits to encrypt the texts, maybe the question should not be â € œWhere I should encrypt my texts, â € â € â € œWhere I wouldn't do it? Â € â € IMESSAGE For years, Apple has maintained the gold standard in industrial cryptography through its Imessage service, which has throughout its history continued to act as a plug in the side of the official application officials and Rogue government agencies. The details of how the unique iMessage cryptograph algorithm works actually are a bit too confused and convolute to explain in full here, however if you are interested you can read through the technical descriptions on page 35 of your own security brief Company starting from the beginning of this year. Even without going through the details of that PDF, Apple's Pedigree Privacy test is in pudding. Apple has been of the six major tech companies who wrote a stern letter to the U.S. House of Representatives condemning the actions of the NSA after Snowden's losses hit the wires, and smartphone maker Cupertino has since continued to stand for his person's privacy rights When threatened with legal action to unlock suspicious criminal iPhones. With everything that in mind, it is clear that the company is dedicated to keeping the text messages of the people where they belong: in their possession, free from the indiscreet eyes of anyone you have not already invited the party. Signal unfortunately, iMessage works only for iOS users. If you are on Android â € "or you are an iOS user who communicates with an Android user â €" you want the signal app from OpenWhisper systems. With it, you can encrypt both calls and SMS messages from an application, without worrying about a complicated configuration process, using separate login, or even remove the profile from the phone before. Signal's protective protocol works by transforming what normally travels as a normal SMS / MMS package in raw data, and then performing that has altered the track through OpenWhisper open source encryption algorithm to ensure that communications are blocked as possible . As long as you and your recipients are both using Signal, your message will be encrypted. Signal will also work with a simple iPhone-to-iPhone transaction, so if you prefer the signal user interface on iMessage for any reason, it is still a valid and safe alternative. You can download Signal from Google Play for free here, or from the iTunes App Store here. Knox Finally, if you are one of the millions that abandoned your iPhone for a Samsung Galaxy in recent years, you will have access to the new KNOX messaging platform available on compatible Android devices. What makes Knox different from software-side encryption solutions like signal or iMessage is different from one of those messages, Knox Texting is protected by a physical encryption chip installed on the phone itself. By performing the Knox platform inside your own, protected hardware sandbox, you can be sure that calls, e-mails or messages entering or come out of the phone are completely separated by any identification information related to the phone itself. A knox limitation is that it works like iMessage, as you will be completely encrypted only when communicating with another Knox device that is already running the same firmware like you. Even so, if the conscious operating system of privacy has passed the vetting process to be good enough for the US defense department, you can be sure that it is good enough for you and your friends too. All the latest iterations of both Galaxy S and Galaxy Note phones are readily Knox directly out of the box, while the complete list of compatible phones and phablets can be found here. In an era of smartphone interception, public and massive Facebook profiles international espionage operations are at risk, you might feel like the days of personal might be at the end. But there's still a way to fight back, and the best place to start is by blocking all your communications behind a secure, secure and secret wall of encrypted text applications. Image credits: Samsung, OpenWhisper 1, 2, iTunes, iTunes, After a series of high-profile hacking, Twitter last week finally joined similar Google and Facebook and introduced two-factor authentication. Users who choose to use the new security tool must now enter a code they receive via a text message sent to their mobile phones whenever they access the microblogging service. While Twitter's decision to provide account holders with two-factor authentication is good news, especially considering the string of news organizations and big brands like Jeep and Burger King who have been hacked in recent months, some experts warn that it will not be enough to avoid hijacking high-profile accounts. For one thing, the new security option is not likely to help organizations that have many staff members posting on a single Twitter account. Of course, not everyone uses the same cell phone. It will also not protect users from man-in-the-middle attacks through which a user is drawn into a fake Twitter login page, enters its login credentials and authentication password to two six-digit factors, thus giving a bad guy input to the account. For brands, a hacked Twitter account can be disastrous. It is not only expensive to close an account and extrude from a hacker control, but there are also relationships with customers and reputation management concerns to consider. Stock prices can also take a beat, as they did in April when the Associated Press account was hacked and the hackers tweeted about explosions at the White House. The good news is that SMS codes sent to mobile phones are far from the only way you can use two-factor authentication to protect your brand. Here are three other good options to consider. Token hardware: YubiKey La YubiKey, made by a Swedish-American company called Yubico, is a small piece of hardware that looks like a USB stick that your customers or employees connect to the USB port of computers. Whenever a user logs into your website or system, he has to press a button on the YubiKey to generate a password once it validates that the person is who they say they are. Yubico also makes a communication variant near the field (NFC) of the device called YubiKey NEO, which allows contactless communication for the security of NFC enabled mobile devices. The proceeds of high-profile companies are providing employees, users and customers of YubiKeys, including Google, Microsoft, the U.S. Department of Defense and the Government of Turkey. Yubico is also a partner with several individual service brands, including OneLogin and Clavid, so that YubiKey can work through dozens of services including Adobe,LinkedIn, and more. It also works with password managers like LastPass, PasswordSafe and Passpack. In fact, the company claims that more than one million users in 120 countries use the hardware token. âA service provider who wants to add support for YubiKey may choose to use OATH, [the open authentication standard,] our free open source server components, or or YubiCloud, CEO of Yubico, Stina Ehrensvard. «With a simple web API, it takes about 20 minutes to integrate YubiCloud, which works immediately with a YubiKey purchased on the Yubico web store. "A company with up to 5,000 users using Yubico" Hardware, software and services can expect to pay $13 a year, for YubiKey, which is around $318,000 for five years. For smaller businesses, Ehrensvard says you can buy a tray of 50 YubiKey from Yubico's web shop. This is a one-time cost of $750 and works with the free version of YubiCloud or free open source software. Ehrensvard said his company is working with Google and other IT giants on a new standard of open authentication: «This should be launched in 2014, allowing our YubiKey Award, the YubiKey NEO, to work out-of-the-box with Google services and a number of other cloud and financial services. "A two-factor authentication solution user can be installed on a company's website with few lines of code, and works through an app on the user's phone. When the person starts accessing a site, the software checks his identity by detecting the computer he is using and the physical location of the phone. Toopher is an ambitious two-factor authentication tool. After installing the Toopher app, you associate it with your web service. The first time the person tries to access your site from a new location, he must give permission to do so through the app. After first access from a particular location, a user can choose to have permissions granted automatically so that the app is performed in the background and functions invisibly. This way, it is different from the SMS-based authentication used by Twitter, Google and Facebook, which require users to enter a code whenever they want to access. Toopher CEO Josh Alexander argues that the annoyance will keep the adoption of the new two-factor authentication option on low Twitter: â¦−Dover pull out the phone from the pocket every time you want to do something so arbitrary as access is too frictional. « Toopher is free for companies with 50 users or not. While the price can be as high as $2.50 per user per month for internal distributions, scale to penny per month per user for sites and companies with thousands of users. A smart complement to two-factor solutions Because it is not a two-factor authentication provider, Impermium based in Redwood City, California, protects websites and individual users from hijacking accounts using statistical models and machine learning owners to provide intelligence on threats and risk-based authentication. Launched in 2010 by Mark Risher, former general manager of Yahoo Mail, the company collected aboutcompanies like customers, including CNN, Pinterest, Typepad and Tumblr. The tie? Why Impermium controls how people areOn all those many sites, including how to use social media, the company is able to know if someone trying to access a site has a model of abuse or a good behavior model. In this way it is able to predict if an attack attack is likely. Basically, it sniffed the deviations in the user's behavior in all those territories online, looking at what devices use people, their network and physical positions and social reputation of anyone who is trying to access a site. Impermium responsibility service monitors your business social networking sites. Impermium offers two products: one for software business users as service platforms and another that protects companies websites. The first, called responsibility, Â ¢ â,¬ "integrates into the site's access flow and performs analysis of the circumstances around someone attempting to connect Â ¢ â,¬" says to rewitch. Â ¢ â,¬ "Only if you are logged in from [your habitual city] from your normal iPad you use all the time, this is a risk-free scenario and identify it as such. If someone is entering with yours credentials from a cybercafÃ© Â © in Indonesia, that is a higher risk scenario and therefore we will give a higher risk score and suggest that [a client] maybe suspend the account, give it some reduced privileges, or ask for secondary authentication Like the Toopher.â, Â »Rise comparable to Impormeni for the alarm system that increases the locks on the main door of your home, and in this way it is an important complement to two-factor authentication solutions. Â ¢ â,¬ "Laubikey and TooperÂ ¢ â,¬ | They are both considered well considered products that reinforce the front door. But a site and an application needs an intelligence, needs risk analysis in real time to determine [if] even if someone has the key, should we leave them or not? Â, â,¬ "not? Â, â,¬
